ABSTRACT

Novel uses of N-piperidine derivatives in therapy, particularly for the treatment of neurodegenerative pathologies

The present invention relates to chemical compounds, pharmaceutical and veterinary compositions, and to the use of such compositions for the treatment or prevention of neurodegenerative pathologies and syndromes such as Parkinson's disease, Alzheimer's disease, lesions due to ischaemia and reperfusion, traumatic brain lesions, due to HIV, Down's syndrome, diabetic neuropathy muscular dystrophy, multiple polyneuropathy, sclerosis, Huntington's disease, prion disease, late dyskinesia, tauopathy and demyelinating pathologies, and other lifethreatening pathologies such as cardiac/renal/pulmonary/ hepatic/intestinal ischaemia-reperfusion, hypertension, diabetes, cancer, shock, toxicity due to drugs and radiation and radiation protection), inflammatory (radiotherapy atherosclerosis, hyperlipidaemia, conditions, aging, hypercholesterolaemia, epilepsy, and rheumatoid arthritis, all of which are known to be associated with an excess production of reactive free radicals. More particularly, the invention relates to compositions containing present antioxidant cyclic (bis)-hydroxylamines derived from Npiperidine as pharmaceutical compositions for the prevention and treatment of pathologies in man and in animals.
